

PROTOTYPES OF HOLOAI

(TECH based product)

(ENGINEERINGS COMPANY)

- **Description of project**

Basically, we are building a product-based company called HOLOAI.

Our first product is a device which is capable of projecting a free space 3D hologram.

Not only able to project 3D hologram in free space it will also connect through your phone, laptop, desktop and so on. Then you are able to use all the basic function which you can perform on your device.

One of the things which we will use in the product is that the hologram and the functions which you need to do can be done by the hand gestures.

Our device also contains gesture control by which you can perform task on the hologram and manage to operate it by hands gestures.

As the name suggest HOLOAI then there will definitely the use of AI in the product so there will also have an in build ai (virtual assistance) which is also capable to open any app or able to perform any function on the hologram, it will be advanced the ai which also monitor the working of hologram and try to maintain it without any error and disturbance.

It will further be updated as per ideas.

And it also contains one mode SECURITY MODE (not the name of the mode just for use) this mode will be use to protect the data to get stole or cyber-attacks.

This idea still underway to discuss.

- **Prototypes of product**

1. Glass based model (1st type)
2. Bezel based model (2nd type)
3. Free space model (3rd type)

Basically, they are the steps by which we can reach the free space 3D hologram

- Glass based product (1st type – Basic model)

1. So, the glass-based idea is that we can build a set up of a glass fit in something and we can project the hologram on the glass, by this I think we can be able to check multiple steps about the developed product.
2. We can check whether it is taking user interface or not and we can also test the gestures control and AI part that is it working good or not.
3. This 1st type of the product is the basic model of the product, which could give us an initial idea that how improvement it need.
4. I think this type is not good launch in the market but it is the good to start with it.

- Bezel based model (2nd type – Medium level model)

- This model is quite good, and if want then we can think to launch this model in market.
- We all have used laptop, so jaise laptop ki screen fit hoti bezel ke beech me waise he hum laser lights yeh fir projection light fit kar sakte hai bezels ke beech for projection of hologram toh jo hologram project hoga woh particular bezel ka beech me he hoga usme koi glass yeh fir screen nhi hogi
- Yeh without glass hai bezels ki dono side koi screen nhi just hologram hoga jo bezels ke beech me display ho rha hoga
- Wasie toh mujhe yeh aacha laga ek type of free space ho Sakata hai bass hume bezels ke thickness kaam rakhne hogi for better look.
- Glass use nhi hoga matalb agar hologram se hand cross kare toh hojaye.
- Jaise bezel is photo ma usme bass screen ke jagah projection hoga aur socha tha ke bezels ko extendable banae ki par abhi uspe Jayada nhi socha hai.

- Free space model (3rd type)
 1. Yeh final model hoga jo free space me hologram project Karega.
 2. Just like jo reel bheji thi usme dekha tha
 3. We can perform any task or activity by projecting the hologram.
 4. Usme sab hoga AI , 3D , security mode for better results and so on.
 5. And that's the final product we will be launching soon.
- Other things to make it better company
 1. We will have to develop the software and app for the product and we will deploy the software on the cloud to become it as SaaS (software as a service) as it is demanding in successful companies
 2. App will be available for both mobile and laptop
Until changes need to be done.
 3. Our product is a hardware product to make it a best and scalable so we also have to marketing for which we are starting an ecommerce marketing from July for passive income and help to promote our product in future.
 4. We also need to build website for the company, App and SaaS.
 5. Our main usp is tech and security mode and we need to solve a good problem to become our product more scalable.
 6. **// must read the next point....**
 7. And ha yeh socha tha hum isme subscription model rakhege jaise ki kise ko normal mode use karna hai uske price different hoga

aur kise ko security mode bhi use karna hai toh uska price alag hoga.

To make it extraordinary we need to solve a good problem and combine it future tech and make the price of it not too high so any can purchase it.
